# Calculation of Heat Flow in KAGRA Cryogenic Payload Masahide TAMAKI (the University of Tokyo & ICRR) \*e-mail: tamaki83@icrr.u-tokyo.ac.jp LIGO-G2301682

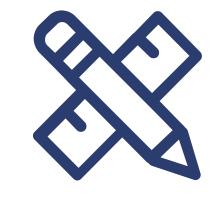

Abstract Cooling of the all main mirrors is one of the main features of KAGRA, and conductive cooling between sapphire fibers or heat links are the main cooling method at cryogenic temperatures. We calculated the heat flow in each heat path and confirmed that there was no unexpected heat flow.

# **1. Introduction**

- •In, KAGRA, the main mirror is cooled down to around 20 K.
- •At cryogenic temperature, thermal conductive cooling is the primary cooling method.
- •For conductive cooling, heat links are connected to the suspension system (sapphire fibers between TM & IM), and there is heat flow (P) through them [1].
- •We calculated *P* and evaluated the

## 2. How to Calculate

• The parameters needed for the Fig1. KAGRA cooling system and heat path (ETMX). calculation are the values in [2], Temperature shown in this figure is current one (2022.08.30). and temperature gradient  $\Delta T$  is calculated from the current cooling conditions (Fig1). •We assume  $\kappa(T)$  as linear with respect to T [2], so we can use thermal conductivity at the average

temperature of both end as the thermal conductivity of the path.

**Parameters** *P*: heat flow [W]  $\Delta T$ : temperature gradient [K] *R*: thermal resistance [K/W] *s*: cross-sectional area [m<sup>2</sup>]  $\kappa(T)$ : thermal conductivity [Wm<sup>-1</sup>K<sup>-1</sup>)] L: path length [m]

(1) TM  $\rightarrow$  IM (2) IM  $\rightarrow$  MNR (3) TMR  $\rightarrow$  MNR

(4) MNR  $\rightarrow$  HLVIS S3 (5) HLVIS S3  $\rightarrow$  Frame Bottom

<u>~~</u>	3. Results	Heat Path	Heat Flow [W]	Heat Flow [W] in O3GK [2]
	•The results are summarized in the table on the right (Tab1).	Path (1): $TM \rightarrow IM$	$0.26 \pm 0.20$ (32.3 K $\rightarrow$ 28.6 K)	$0.36 \pm 0.20$ (22.3 K $\rightarrow$ 18.7 K)
	•Main contribution of the error is	Path (2): $IM \rightarrow MNR$	$1.7 \pm 0.5$ (28.6 K $\rightarrow$ 20.2 K)	$1.1 \pm 0.5$ (18.7 K $\rightarrow$ 14.7 K)
	temperature accuracy of thermometer.	Path (3): $TMR \rightarrow MNR$	$\begin{array}{c} 0.59 \pm 0.50 \\ (21.8  \text{K} \rightarrow 20.2  \text{K}) \end{array}$	$1.1 \pm 0.5$ (17.2K $\rightarrow$ 14.7 K)
	4. Discussion & Outlook	Path (4): $MNR \rightarrow HLVIS S_3$	$1.6 \pm 0.4$ (20.2 K $\rightarrow$ 15.6 K)	$0.99 \pm 0.44$ (14.7 K $\rightarrow$ 12.1 K)
	•Compared to O3, MNR is not	Path (5): HLVIS $S3 \rightarrow BF$	$0.98 \pm 0.25$ (15.6 K $\rightarrow$ 13.9 K)	$1.1 \pm 0.3$ (12.1 K $\rightarrow 8.80$ K)
	sufficiently cooled (need to investigate	Tab1. Result of heat flow calculation		
	<ul><li>or think about the reason for this), but there does not seem to be any unexpected heat flow.</li><li>A similar investigation should be conducted once the other suspensions have been cooled.</li></ul>
